DEVELOPMENT

Project Statement

By converting underutilized right-ofway land into a demonstration wetland and ecocentric park, this project aims to reintroduce nature into the developed urban setting to support biodiversity, strengthen the surrounding community, and spark environmental stewardship.

When imagining a typical urban park, what often come to mind are large areas of turf with a sprinkling of active recreation facilities, such as sports courts and skate parks, and some path systems tying everything together. Conspicuously absent from that picture is the feeling of nature.

Nature: the phenomena of the physical world collectively, including plants, animals, the landscape, and other features and products of the earth, as opposed to humans or human creations

Considering the man-made reality of urban parks and community needs for specific types of recreation, it's understandable that the natural world has been omitted in many parts of the city. However, nature and natural systems in the urban setting can provide a wealth of benefits to both people and the environment.

In dense urban areas where land is a precious commodity, open spaces should address multiple dimensions of need to maximize their contribution. Natural systems can improve water quality and encourage groundwater recharge while supporting ecosystem needs such as climate regulation and habitat.

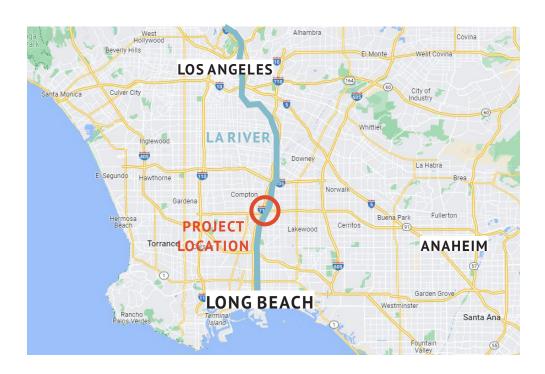

On the human axis, exposure to nature has been shown to have beneficial effects on health and wellness by promoting physical activity and reducing stress and anxiety. In children, nature exposure encourages curiosity and engagement, and it has a positive correlation with improved behavior and concentration.

Beyond regarding nature for its performance, however, there's the more philosophical issue that entails humankind's connection with the natural world. As our society loses touch with nature, we lose the sense of wonder that is sparked by discovery of nature's beauty. Not only

does this rob us of a basic human joy, but this also makes issues like environmental degradation and biodiversity loss something abstract and removed from our concerns rather than acutely felt as direct consequences of our actions.

The proposed project site is within the Hamilton neighborhood of North Long Beach, a community that has a high need

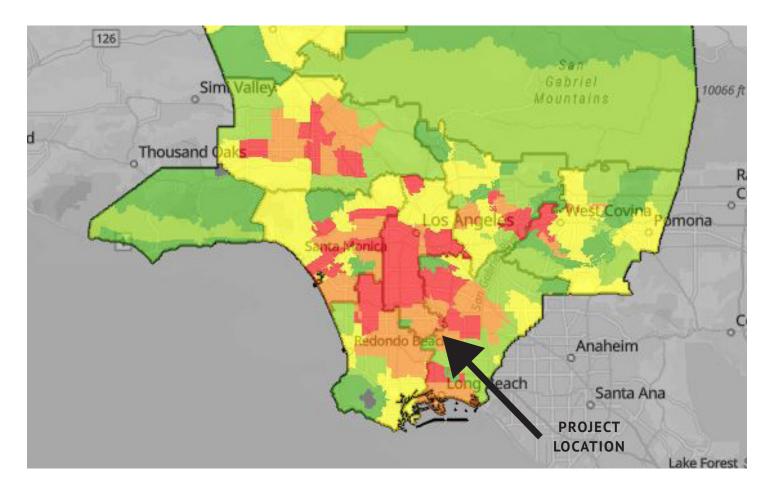

for open space. The lack of naturalistic park space is even more dire in lower-income neighborhoods, where people may be less likely to travel long distances for nature retreats because of inability to take time off work, the cost of travel, lack of automobile access, etc. Even without having to seek out far-off places, every person should have the opportunity to feel nature around them.

An ecocentric park can improve environmental health and strengthen the surrounding community by providing a unique space that is connected to nature.

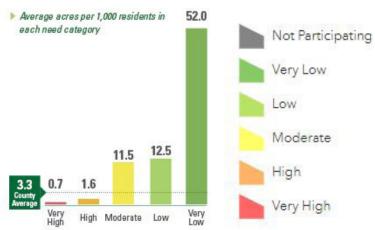

Project Justification

The proposed project fulfills a variety of planning needs, including the LA County Parks Needs Assessment, Long Beach General Plan, LA River Master Plan, and Uptown Open Space Vision Plan.

LA County Parks Needs Assessment Average acres per 1,000 residents in

- High need area with only 1.1 acres per 1,000 residents compared to county average of 3.3 acres
- Considered a Priority area for Environmental Restoration

Long Beach General Plan

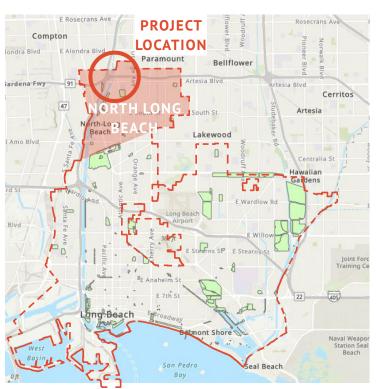

- Goal: Increase Access to, Amount of, and Distribution of Green and Open Space
- Goal: Preserve, Protect, Restore, and Reconnect with Natural Resources

City of Carson City of Carson

Open Space PlaceType

- Location considered Open Space PlaceType
- Purpose is to promote the emotional and physical health of urban residents through contact with natural environments

Neighborhood-Serving Centers and Corridors PlaceType

- Location adjacent to Neighborhood-Serving Centers and Corridors PlaceType
- Purpose is to promote a neighborhood's unique identity, focus on healthy goods and services, enhance pedestrian and bicycle connections to neighborhoods, provide community gathering places, and provide convenient access to transit

Long Beach Park Distribution

- Project contributes to General Plan park target of **8 acres** per 1,000 residents
- Long Beach City average is **4.4 acres** per 1,000 residents.
- At **1.2 acres,** North Long Beach lags far behind.

Project Justification

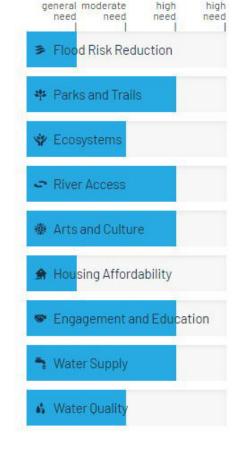

BURBANK GLENDALE **DOWNTOWN LA** VERNON **BELL GARDENS** SOUTH GATE PROJECT LOCATION COMPTON LONG BEACH

LA River Master Plan

- Part of an area identified as a candidate project site
- High needs for Parks and Trails, River Access, Arts and Culture, Engagement and **Education, Water Supply**
- Moderate needs for Ecosystem and Water Quality
- Site located at a gap in river access

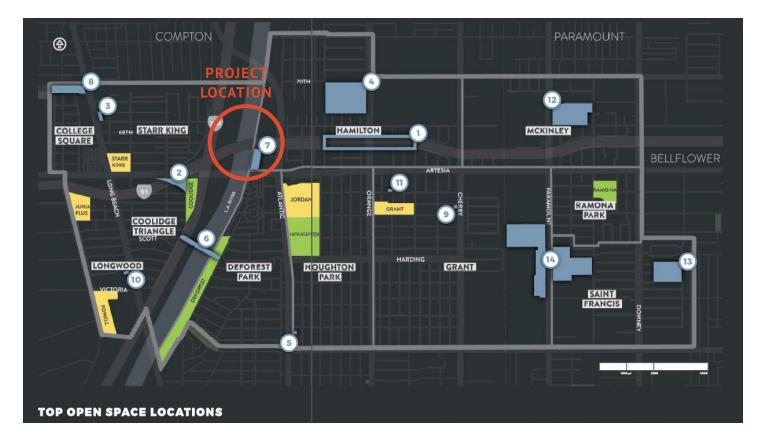

Alondra Boulevard

East Artesia Boulevard

Uptown Open Space Vision Plan

- Identified in a community workshop with 635 North Long Beach residents as a potential park space
- Site ranked number 7 out of 55 opportunities

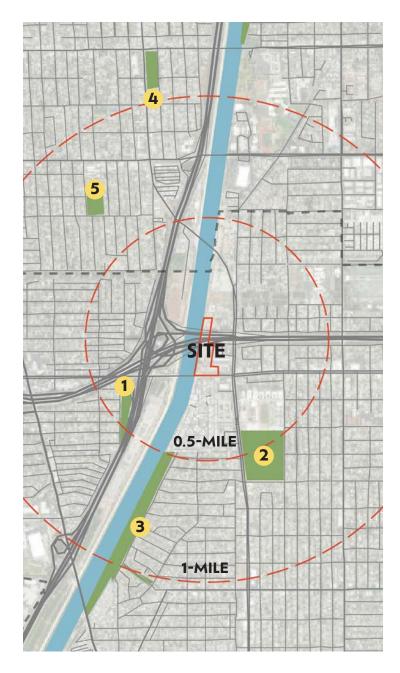

• Top three desired amenities for the Hamilton neighborhood are walking trail, dog park, and picnic area.

PROJECT

LOCATION

Project Justification

Beyond fulfilling planning needs, the proposed project can give the nearby community a different type of outdoor experience. Nearby parks are all heavily programmed, and they consist primarily of large areas of turf with minimal other types of landscaping. A park with more passive recreation that provides ecosystem services would fill a gap in the community.

Design Methodology

The design methodology is comprised of a three-prong approach that encompasses ecology, water, and people.

Ecology

- Principles of Ecological Landscape Design
- Millennium Ecosystem Assessment: Ecosystems and Human Well-being: General Synthesis
- LA River Master Plan (Biodiversity Profiles)

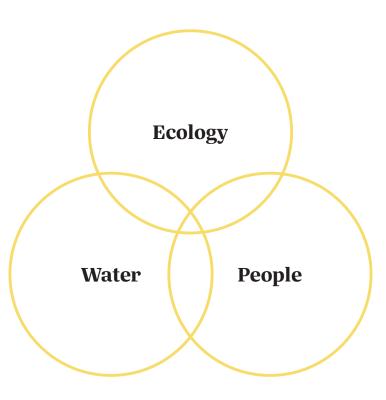

Water

- Low Impact Development: A Design Manual for Urban Areas
- Treatment Wetlands

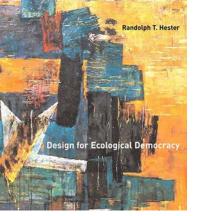

People

- Design for Ecological Democracy
- LA River Master Plan (Kit of Parts)

PLAN

2

Design Methodology

Ecology

Principles of Ecological Landscape Design

- Design landscapes to provide ecosystem services
- Work with regional soils
- Select plants with different niches to grow together

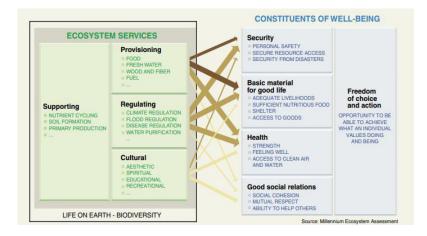

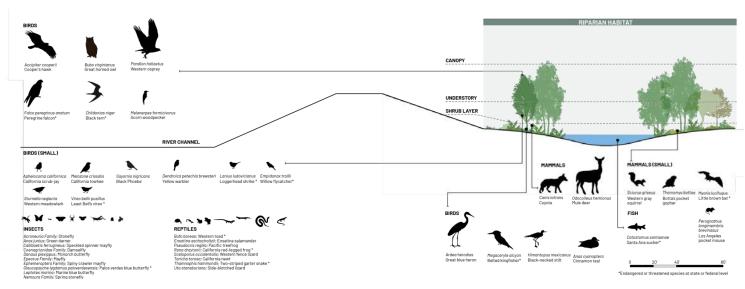

Image source: Millennium Ecosystem Assessment

- Meet plant water needs through contouring and drainage
- Shape patches for ecological function

LA River Master Plan Biodiversity Profiles

- Concrete Channel Conditions
 - Algae as food source for birds
- Riparian Landside Right-of-way
 - California Walnut Woodland
 - Southern Coast Live Oak Riparian Forest
 - Southern Cottonwood-Willow Riparian Forest
 - Southern Sycamore Riparian Woodland

• Upland Landside Right-of-way

Precedents

South Los Angeles Wetland Park

Los Angeles, CA Size: 9 acres

Completed: 2011

Designer: Psomas, Mia Lehrer + Associates

Budget: \$12.4 million Funding: Proposition O

Former land use: Brownfield (bus yard)

Key Takeaways

- Taps into existing drainage system
- Additional water pre-treatment system
- Plan for extreme weather conditions
- Provide shade
- Ensure educational content is in both English and Spanish
- Set intentional objectives for community engagement and education

Before

After

Boardwalk

Ballona Freshwater Marsh

Los Angeles, CA

Size: 26 acres+25 acres riparian corridor Completed: 2008 (Phased over 7 years)

Designer: Unknown Cost: >\$30 million

Former land use: Agriculture (celery field),

previously high tidal marsh

Key Takeaways

- Similar watershed/contributing drainage area
- Design for concentrated areas of intensive maintenance
- Maintenance may include community education and engagement to promote good stewardship
- Restoring habitat can lead to rapid repopulation by bird communities
- · Work together with upstream systems for maximized water quality improvements

Precedents

Dominguez Gap Wetlands

Long Beach, CA

Size: 37 acres+15 acres spreading grounds

Completed: 2008

Designer: CH2MHill + LA County

Cost: \$7.1 million

Former land use: Spreading grounds,

previously flood control basin

Funding source: LAC Flood Control District, State Water Resources Control Board, Coastal Conservancy, Rivers and

Mountains Conservancy

Nature trail with wildflowers

Key Takeaways

- Successful conversion of detention basin with pump station to wetlands
- Selected plant species are successful
- Provides wildlife habitat
- Connection to LA River bicycle path
- Water quality performance seems successful, but measurable data is elusive
- Incorporate better wayfinding both within and outside the site

Chino Creek Wetlands and **Educational Park**

Chino, CA

Size: 22 acres

Completed: 2007

Designer: Inland Empire Utilities Agency, Educational signage: Jaenichen Design

and Richard Turner

Cost: Unknown

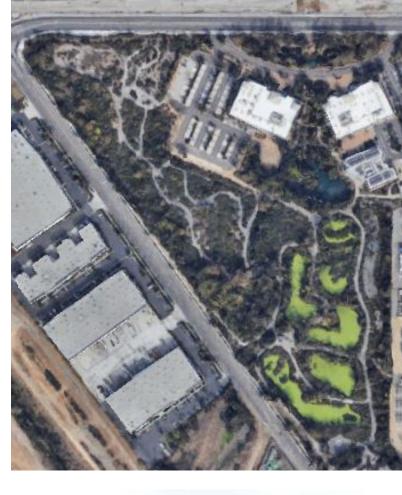

Former land use: Buffer zone of wastewater treatment plant

Funding source: Partially funded by State

Water Resources Control Board

Key Takeaways

- Robust educational content
- Active community engagement through educational programming
- Online presence extends reach of park
- Interactive elements
- Community gathering amenities
- Demonstration wetlands include different types of water quality improvement systems
- Algae growth may need to be monitored

Entry bridge

F: Artesia Blvd bridge at LA River

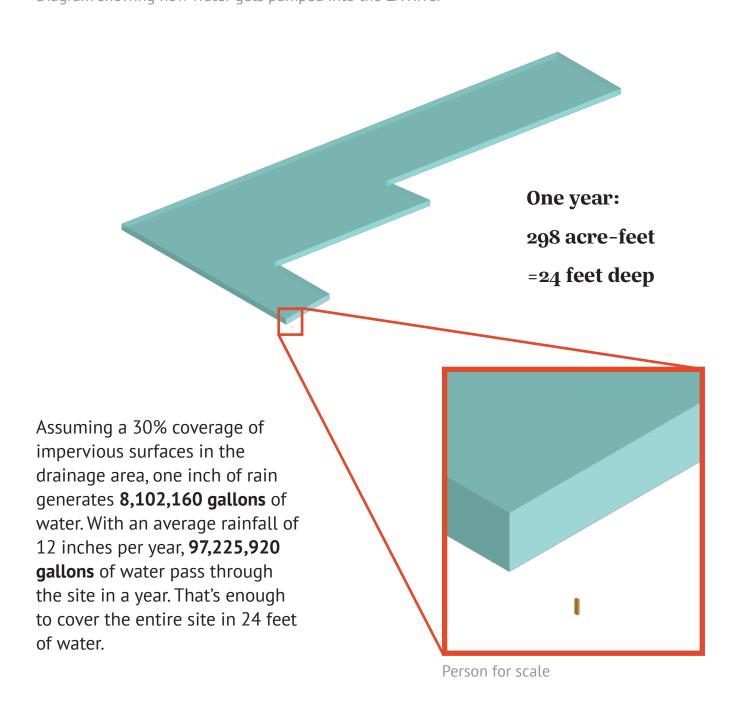

Water

The contributing drainage area to the site is roughly 1,000 acres. All the stormwater runoff from this area is routed to the pump station, and then it gets pumped out into the LA River.

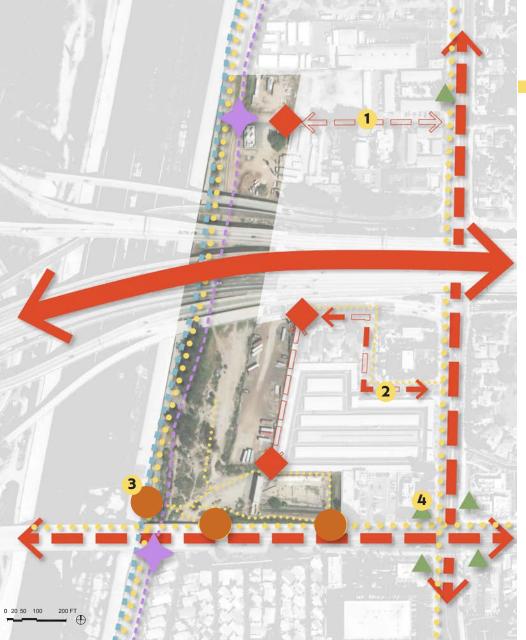

Circulation & Access

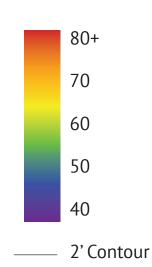

- Freeway
- Arterial Road
- ■ Docal Road
- □□⇒ Service Road
- Pedestrian Circulation
- Bicycle Trail
- Equestrian Trail
- Vehicular Access Point
- Pedestrian Access Point
- **Equestrian Access Point**
- Bus Stop

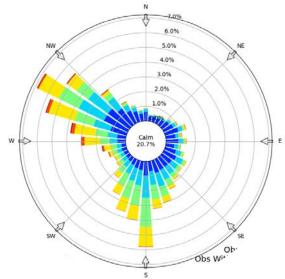

- Public access is difficult from small, private road
- Potential vehicular access from a quiet local road
- 3 Access from LA River trail through chain link fence is ambiguous
- Proximity to major intersection with bus stops from all directions

Site Analysis

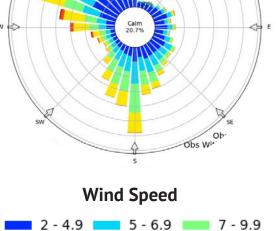

Topography & Wind

- HP High Point
- LP Low Point

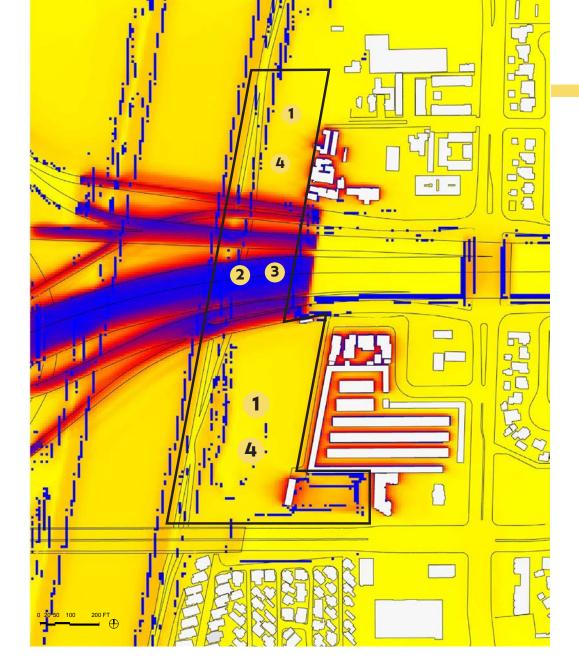

- Embankment protects from strongest winds
- Potential access points to/from LA River trail where elevation drops
- Deep and steep basin is difficult to naturalize
- Street access is difficult because site is at lower grade than surroundings

Sun Hours

2 <:

- 1 Add additional shade for comfort in full sun areas
- 2 Limited plant choices in heavy shade
- **3** Potential as cooler microclimate
- 4 Potential for varied types of planting in full sun

Site Analysis

Special Status Wildlife

Current conditions are not favorable to wildlife. With restored vegetation, a variety of special status birds, reptiles, and insects could potentially inhabit the site. The site could also provide habitat for a larger variety of local wildlife and serve as a stopping point for migratory birds.

Loggerhead ShrikeOpen habitats with sparse shrubs and trees

Cooper's Hawk
Dense stands of live oak,
riparian deciduous, or other
forest habitats; areas near
water used most frequently

Yellow Warbler
Breeds in riparian
woodlands: cottonwoods,
willows, alders, other small
trees and shrubs

Peregrine Falcon
Forages for birds including
waterfowl and shorebirds,
typically in coastal areas
and wetlands

San Diego Horned Lizard
Occupies coastal sage scrub,
chaparral, and other open
habitats

Two-Striped Garter SnakeFound near permanent and ephemeral fresh water

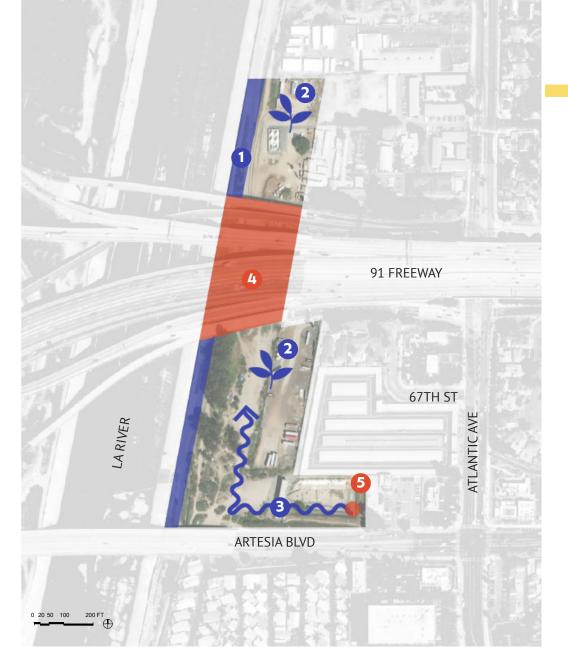

Monarch Butterfly
Roosts in wind-protected
tree groves with nectar and
water sources nearby

Opportunities & Constraints

- 1 Enhance planting along LA River
- 2 Use full sun areas to maximize diversity of plantings
- 3 Reroute water pump to onsite wetland pond to provide riparian habitat and filter water
- 4 Limited potential for planting in deeply shaded area under freeway
- Low invert elevation of stormwater outlet makes pump necessary for flood control

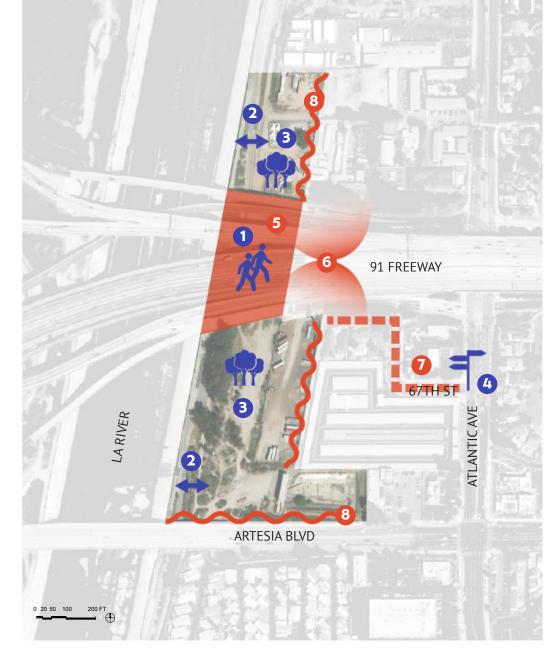

Site Analysis

Opportunities & Constraints

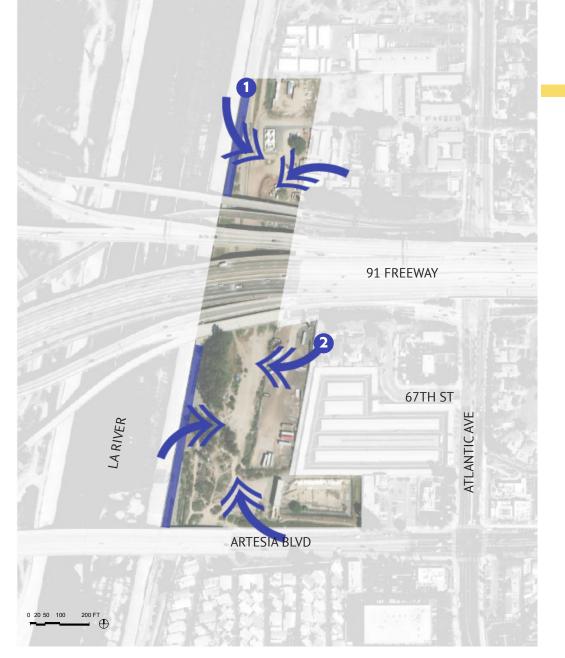

- 1 Incorporate high-use program elements to draw people to and through space
- 2 Add access points to/from LA River Trail
- 3 Plant trees to intercept pollutants and provide shade
- 4 Guide visitors through wayfinding signage from street
- 5 Noise and poor visibility create unpleasant conditions and potential safety issues
- Air quality issues from freeway
- 7 Access from local road may be hard to identify
- Lower grade and difficulty accessing site prevents connection to surrounding neighborhood and LA River

Opportunities & Constraints

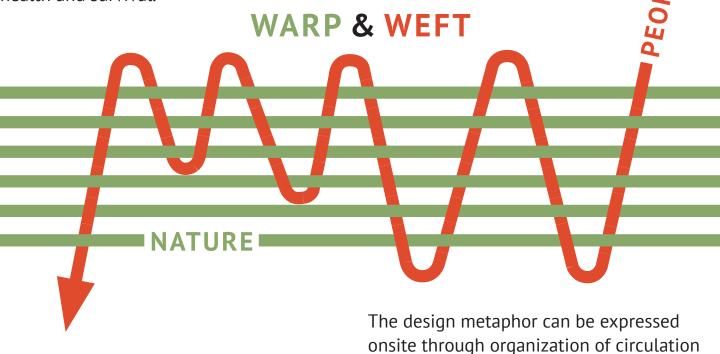

- Encourage visitors to observe the flow of the LA River
- Bring people into interior of site for natural experience

Design Metaphor

The design metaphor for the site is Warp & Weft, which is based on the idea that people are reliant upon nature for our basic needs—such as textiles, which we use every day. The concept of the site is to weave nature and people together. A warp is the strong foundational element that forms the basis of any kind of weaving, in this case the restored natural environment. A weft is the thread that's interlaced through the warp, in the case the community. By becoming entwined with nature, people can learn to appreciate how important the environment is to our health and survival.

Materials

and programming and be reinforced

through use of woven materials.

Program

Habitat Restoration

Picnic Area 2,000-4,000 SF

California Native Plant Communities

Wayfinding

Parking Lot 0.25-1 acres

Restroom

Interpretive Signage

Three initial concept explorations incorporating the design metaphor:

Concept 1: Threads

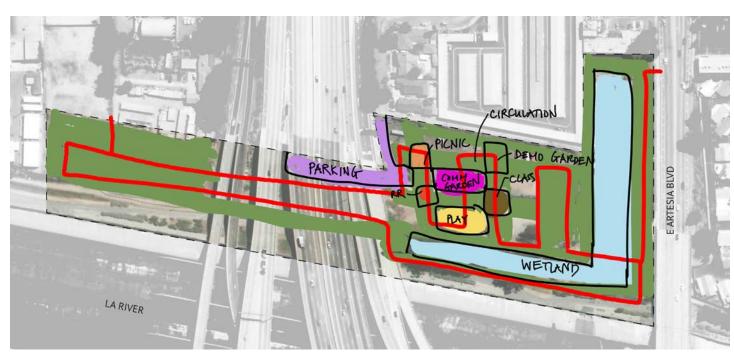

The circulation path weaves throughout the site, and the program elements are interspersed throughout.

Concept 2: Concentration

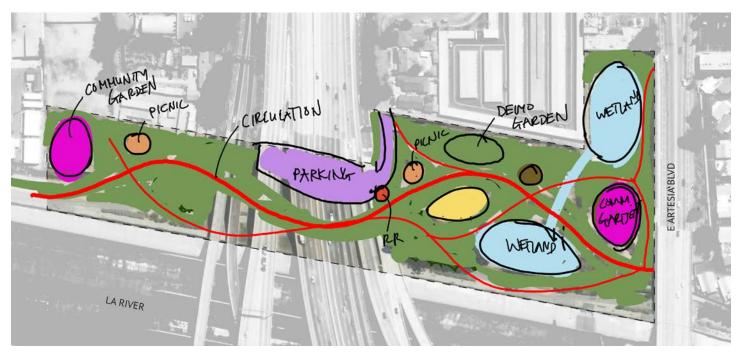

Major program elements are concentrated into a single area, and the primary circulation weaves through them.

Concept 3: Diversion

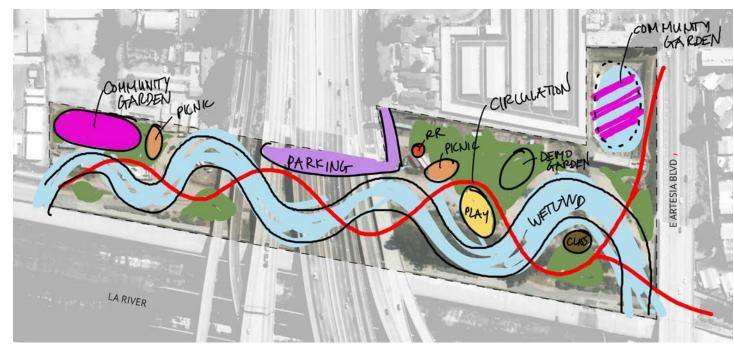

Circulation, water, and planting are entwined, and water would be diverted from the LA River to run through the site.

Concept 2: Concentration

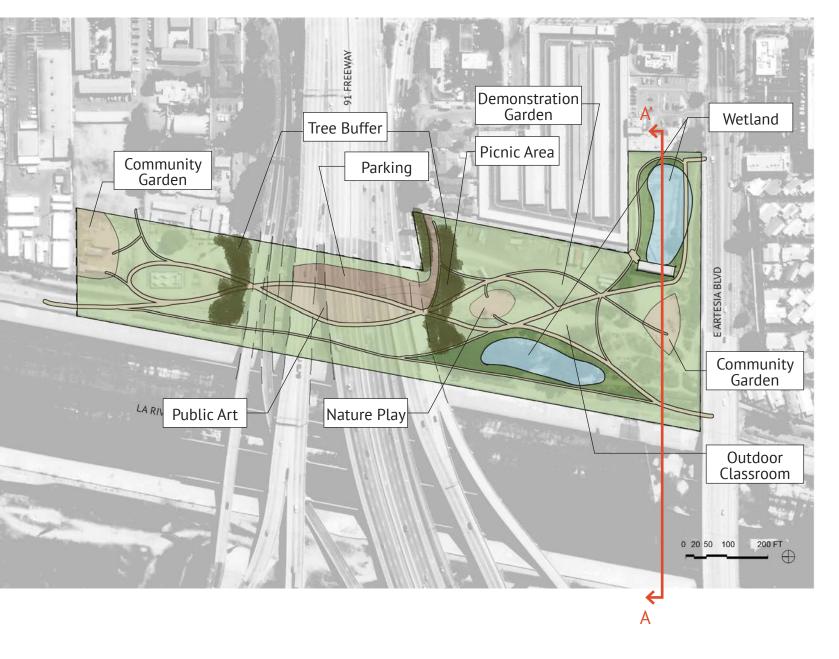

Concept 1: Threads

Concept 3: Diversion

Concept 1: Threads

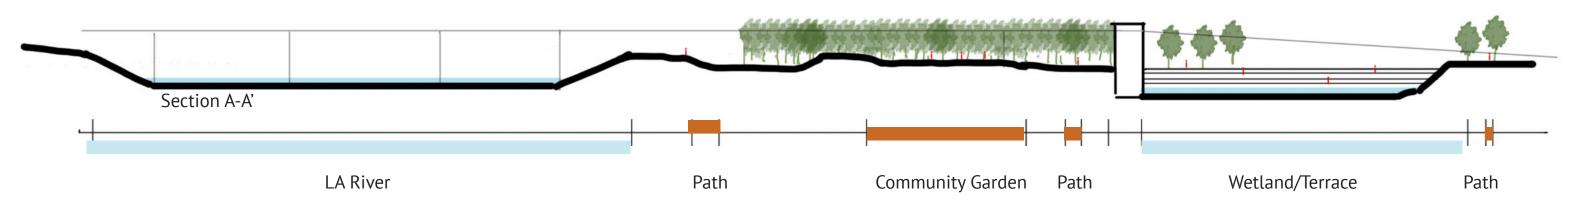

Pros:

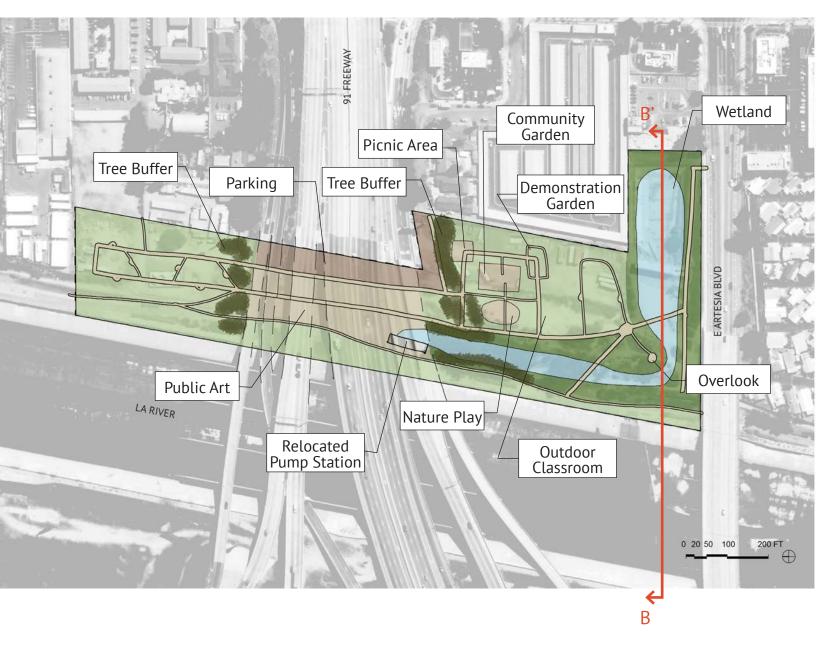

- Minimal grading
- Keep existing infrastructure
- Covered, shaded parking
- Parking close to more active programming
- Nature play and outdoor classroom close to wetland environment
- Activities dispersed throughout park

Cons:

- Community garden far from parking
- Play and picnic areas relatively close to freeway
- Tree buffers near freeway may make underpass even darker
- Smaller riparian planting area

Concept 2: Concentration

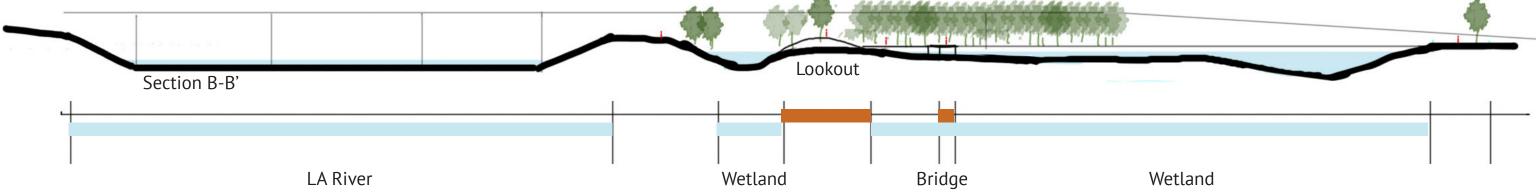

Pros:

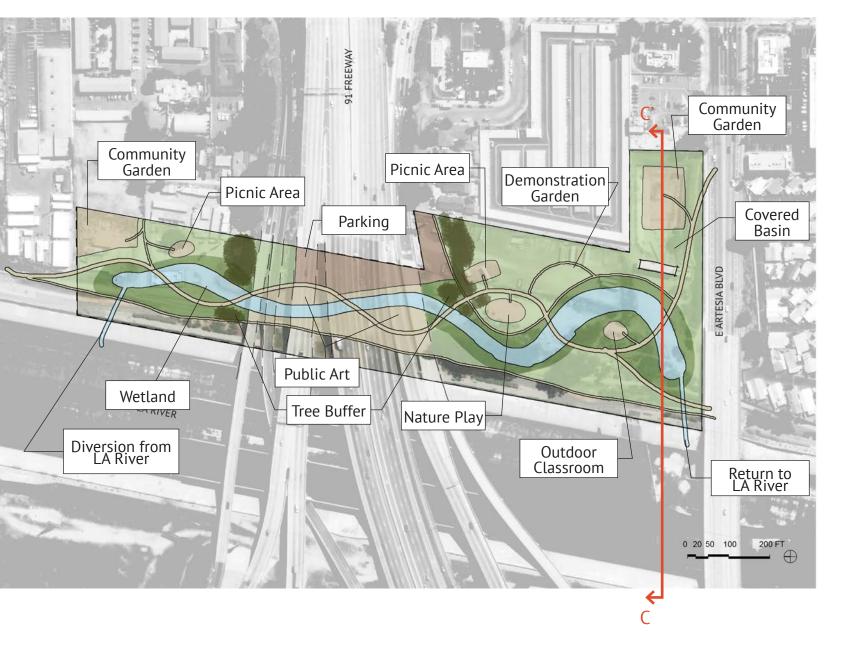

- Grouped programming close to parking
- Covered, shaded parking
- Larger naturalistic immersion areas at far ends of park
- Generally follows existing contours of site
- Memorable entry from LA River over a bridge
- Varied vantage points
- Larger riparian habitat areas

Cons:

- Pump station must be relocated
- Steep grading necessary to drain to new pump station location
- Supplemental water source may be necessary
- Majority of programming relatively close to freeway
- Conflict of community garden with general park users

Concept 3: Diversion

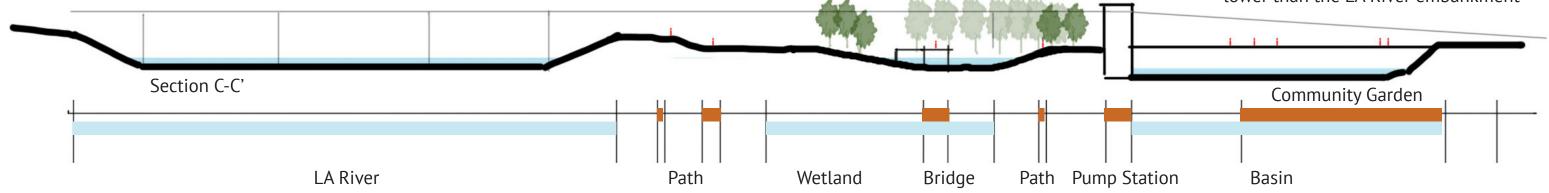

Pros:

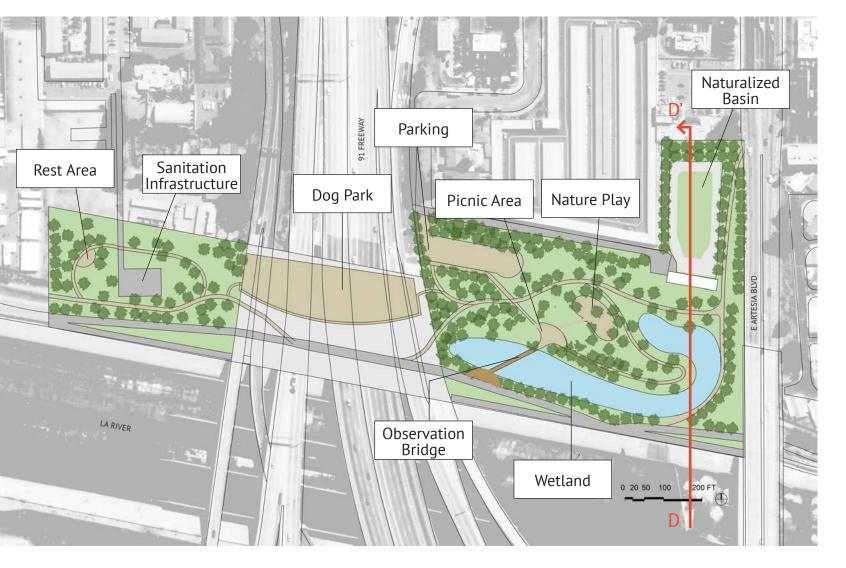

- Includes water quality improvements to upstream sources
- Water infiltration
- Existing basin and pump station remain functional
- Maximum riparian habitat and connectivity
- Covered, shaded parking

Cons:

- Heavy grading
- Majority of park will be sunken even lower
- Diversion method from LA River necessary to provide water
- Play and picnic areas relatively close to freeway
- Entrances from LA River are at extreme ends of the park
- Flood control risk because the site is lower than the LA River embankment

Refined Concept

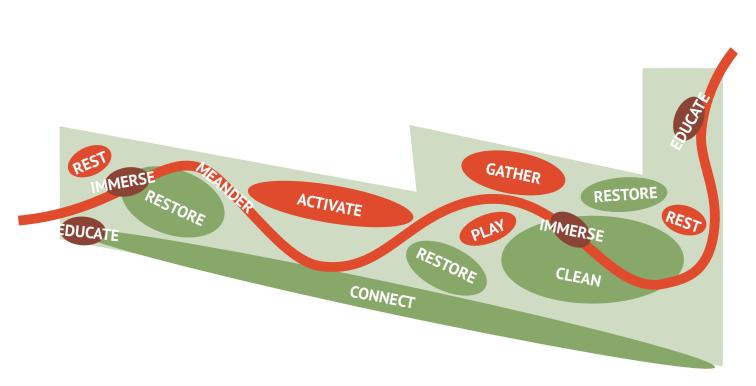

Concept Diagram

In the final concept, community elements are woven through the restored natural environment. There are opportunities to spark environmental stewardship at the interface of people and nature.

LA River

Pump Basin

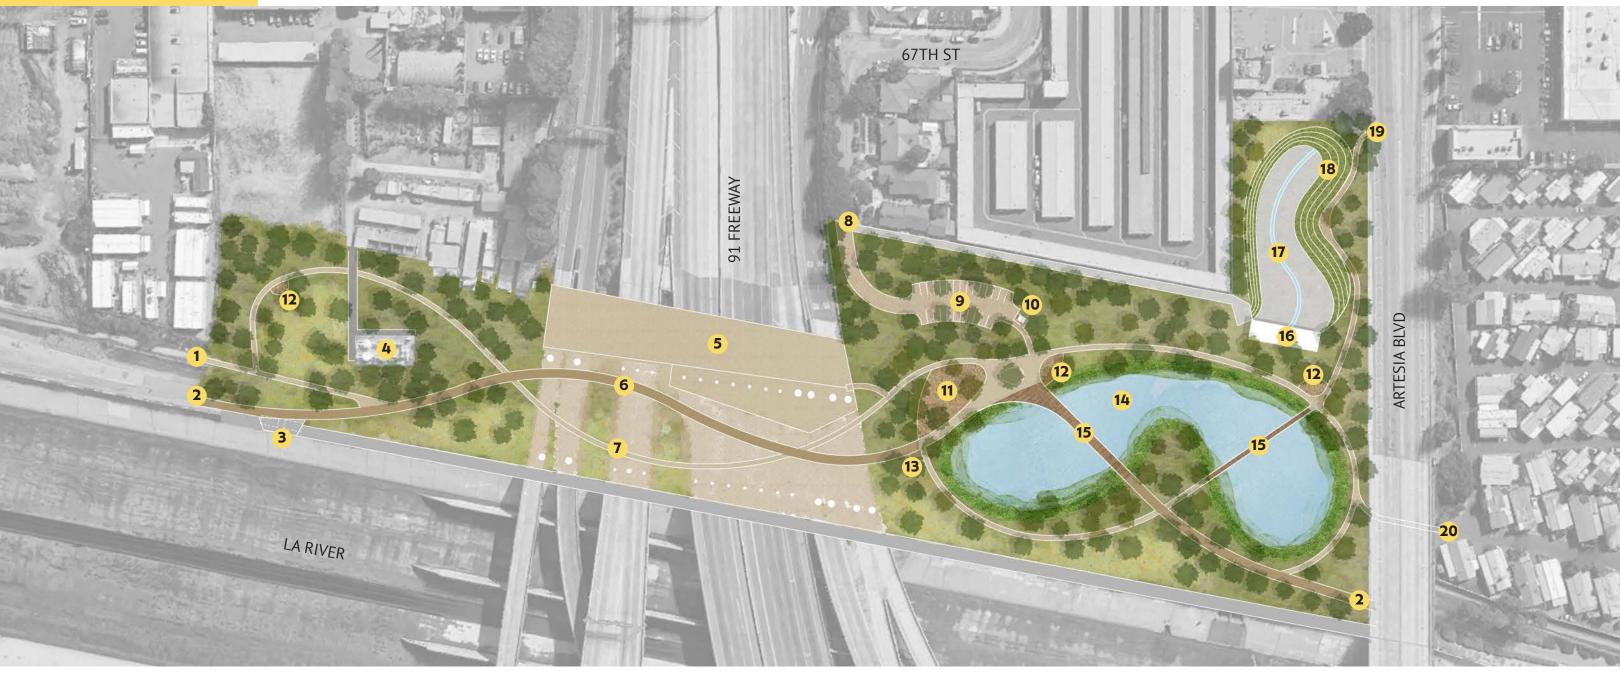

Elevation D-D': Existing

LA River

Wetland

Pump Basin

Illustrative Plan

The site has been transformed from barren remnant land to a nature haven. Stormwater runoff is diverted at the pump station to a constructed wetland, which retains and filters the water onsite. Circulation paths weave throughout the site, bringing people through large restored areas of planting, where they can experience a little bit of nature in their own neighborhood.

Section B-B' Existing

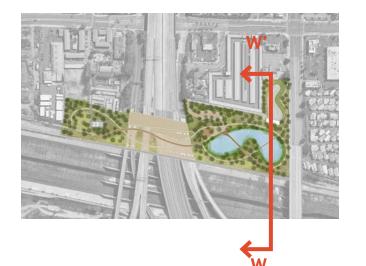

Section B-B' Proposed

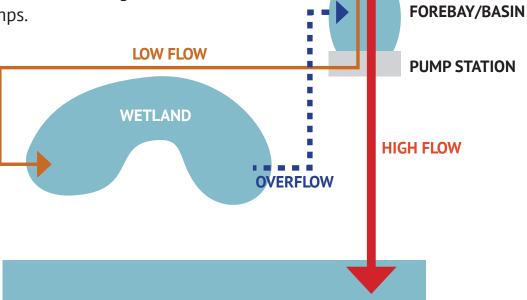

100 FT

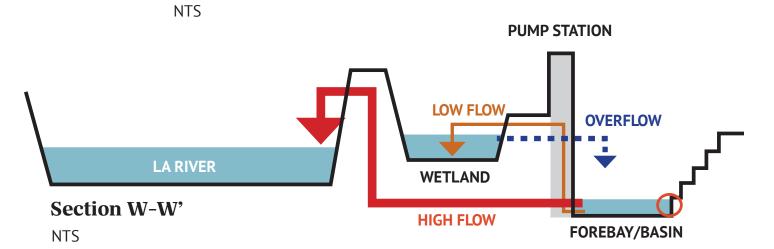

Water Flow Diagram

In dry months, runoff enters into the pump station basin, and the low-flow polluted water is pumped into the wetland to capture and clean it using one of the six existing water pumps. During the wet season, overflow water drains back into the basin. The overflow water, in addition to high-volume runoff from the contributing drainage area, would be pumped out to the LA River through the remaining five pumps.

Plan

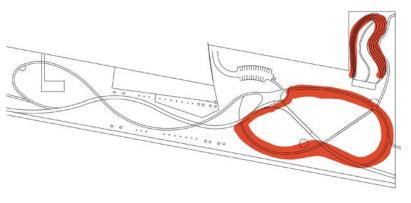

LA RIVER

Plant Communities

Riparian

Riparian planting forms the backbone of the constructed wetland. In addition to providing ample habitat to birds, riparian plants can filter polluted stormwater, cleaning up the water that eventually gets released into the LA River.

Artemisia douglasiana Mugwort

Baccharis emoryi Emory's baccharis

Carex praegracilis Clustered field sedge

Juncus mexicanus Mexican rush

Muhlenbergia rigens Deergrass

Vitis girdiana Wild grape

Platanus racemosa Western sycamore

Populus fremontii Freemont cottonwood

Salix gooddingii Goodding's willow

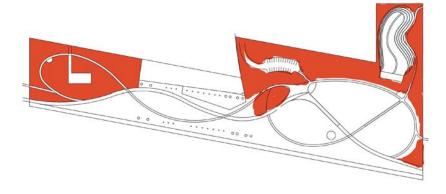

Salix laevigata Red willow

Plant Communities

Coastal Sage Scrub

Drought-tolerant with high habitat value for local wildlife, coastal sage scrub forms the majority of the restored planting areas. Plants that flower and fruit at different times of year ensure food supply for birds, mammals, and insects.

Acmispon glaber Deerweed

Eriogonum fasciculatum California buckwheat

Salvia leucophylla Purple sage

Artemisia californica California sagebrush

Heteromeles arbutifolia Toyon

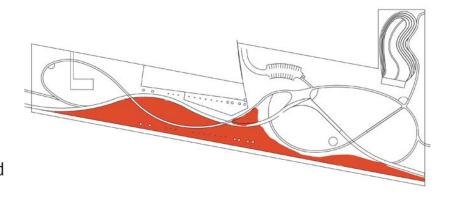

Salvia mellifera Black sage

Plant Communities

Grassland/Oak Savanna

Native grasses and annual flowers are planted along the LA River embankment, providing open space habitat for wildlife and seasonal blooms for human visitors. The intermixed borders of grassland and sage scrub communities provide more varied habitat conditions.

Baccharis pilularis Coyote brush

3 River Observation Area

North Area

At the river observation area, visitors can see the water level and flow of the LA River change over the seasons. Interpretive signage can inform them about how the wetland pond helps clean the water before it is pumped into the LA River.

E: View from the multi-use path, exiting the underpass

Conclusion

Large areas of different plant communities provide habitat for local wildlife. A constructed wetland and reworked basin improve water quality. Planting within the site itself and along the LA river contribute to overall ecological connectivity.

Strengthen Community

This park incorporates picnic areas, a dog park, and a walking trail, which are the top desired amenities identified by the community. The walking trail and quiet resting points help contribute to community health, and additional access points help connect the park to the surrounding community.

Spark Stewardship

At the interface of people and nature, there are play areas, views of natural beauty, and educational signage to inspire people to appreciate nature and to become good stewards of the environment.

By giving local residents opportunities experience and meander through a little bit of nature in their own neighborhood, this park can become a community asset and cultivate an appreciation for the natural world.
